MATERNAL AND CHILD HEALTH SERVICES

1957

General

All the States, the District of Columbia, Puerto Rico and the Virgin Islands receive Federal funds to extend and improve services for promoting the health of mothers and children. The program is administered under Title V, Part I, of the Social Security Act.

The maternal and child health program includes a variety of services, not all of which are provided in all States. The services selected for annual statistical reporting to the Children's Bureau which are presented in this report are those most commonly provided by the States. They are reported if provided or purchased by State or local official health agencies.

In addition to the reported services, nearly all States include in their programs study of the causes of maternal, infant, neonatal and perinatal deaths, usually in cooperation with medical societies and hospitals. In-service training of maternal and child health personnel is a part of every State's program. Many States conduct short institutes for physicians, nurses, nutritionists, medical social workers, hospital administrators, and others. Each year several States award education or training grants in public health or other professional disciplines. An increasing number of States are offering consultation to improve hospital services through a team that may consist of a pediatrician, an obstetrician, nurses, and sometimes a nutritionist and a medical social worker. Such consultation services are usually given to the newborn nursery service of the hospital, less frequently to the maternity and pediatric services.

As a result of increased funds for mental retardation, 44 State health departments have developed services for mentally retarded children. Usually the core of this service is a diagnostic, evaluation and treatment clinic for children and counseling for parents.

Since mortality and morbidity from accidents loom large in childhood, a number of States also have developed accident prevention programs under maternal and child health auspices.

Schedules providing the information presented in this report were received from the 48 States and from the District of Columbia, Alaska, Hawaii, Puerto Rico, and the Virgin Islands. To avoid cumbersome verbiage the word "State" as used throughout this report refers to these 53 jurisdictions.

The forms used in the reporting of the data were revised in 1956 and are described in the report for that year (Children's Bureau Statistical Series No. 49). Because of the numerous redefinitions of reporting bases then, few comparisons of that year's record of services rendered with those of previous years were possible. The 1957 statistics shown herein will be compared with 1956 data in the following pages wherein State reports have been added together to show the overall totals throughout the nation for each of these two years.

Trends

A certain amount of shifting of emphasis is reflected in the figures representing mothers and children provided services in 1957 and 1956. Certain areas of service increased in 1957 while others remained about equal to the previous year and a few were curtailed. Gains were registered in such important categories as medical clinic service to mothers, well child conference service, and immunizations. Table A presents totals of the number of mothers and children who received selected types of direct service in 1957 and 1956, the percentage difference between the two years, and the number of States which provided each type of service in each year. Table B presents totals for other services. These are discussed below for each of the major classifications.

TABLE A.--Number of Mothers and Children Receiving Direct Services, by Type of Service, United States, 1957 and 1956

Type of service	Number reported		Percent change 1956-1957 + or -	Number of States providing this service	
	1957	1956		1957	1956
Selected maternity services:

Other classes.....	84,765	55,232	+53.5	27	25

Maternity Service

Mothers receiving maternity medical clinic service increased in number from 225,624 in 1956 to 240,630 in 1957, a gain of 6.7 percent. This service, provided under the maternal and child health programs of 35 States includes consultation, diagnosis, treatment or follow-up care in clinics organized to provide antepartum or postpartum services with a physician in attendance.

All of the 53 States also provided maternity nursing services to mothers during and following pregnancy. In 1957, 446,843 mothers received this service, a gain of 2.9 percent over the 1956 total. These figures are in addition to nurses' services at medical clinics where physicians were present.

figure 1. MOTHERS RECEIVING SELECTED MATERNITY SERVICES

Services to mothers in both the antepartum and postpartum periods generally extend over several months. As a consequence about one-fourth of the mothers counted as having received service in 1957 are included also in the 1956 count, since service to them began in that year. This duplication is avoided if we eliminate the "carry-overs" and count only those mothers who were first admitted to maternity medical clinic service in each year. In 1957 there were 180,797 mothers new to this program, compared with 173,730 in 1956. (The 1956 figure is partially computed since 6 States did not furnish the breakdown between new cases and carry-overs in that year.)

Maternity services furnished by a minority of the States included dental treatment during pregnancy, which was provided by 17 States in 1956 and 12 in 1957, and hospital inpatient care, provided by 12 States in 1956, 13 in 1957. The latter is a selective type of service usually given for the more serious complications of pregnancy. Mothers receiving dental treatment declined in number from 9,603 in 1956 to 3,583 in 1957. Mothers receiving hospital care increased in number in 1957 to 39,562, 13.4 percent above the 34,898 number so served in 1956. Hospital care was provided by 13 States in 1957 as compared with 12 in 1956.

Child Health Service

Under State maternal and child health programs, services are rendered to children of all ages. Included among the services which are furnished by some or all of the States are well child conferences, a program for infants and preschool age children, general pediatric clinics or specialized clinics for diagnostic services, visits by public health nurses to children of all ages, topical fluoride applications, dental treatment, hospital care for infants, school health examinations and screenings, and immunization against communicable diseases.

Clinics for the general health supervision of infants and preschool children, generally known as well child conferences, render service under the supervision of physicians. They are to be found in towns and cities throughout all of the States.

Of a total of 1,326,277 infants and preschool children served in well child conferences, 557,801 or 42 percent were infants. Thus the coverage of infants in this field of service is far more intense than is the case for children in the preschool ages, which cover approximately a 5-year span.

figure 2. CHILDREN SERVED BY WELL CHILD CONFERENCES

Well child conference

Infants	1957		557,801
	1956		517,243
Preschool:	1957		768,476
	1956		769,102

Public health nurses not only participate in the work of well child conferences but also render services in homes as well. These services minister to the needs of children of all ages in a multiplicity of ways, including educational activities in the form of advice and guidance to parents and children. Public health nursing service for children, in addition to the attendance of nurses in well child conferences and in schools, was provided by 51 States in 1956 and 52 in 1957.

**figure 3. CHILDREN RECEIVING NURSING SERVICE
OUTSIDE WELL CHILD CONFERENCES AND SCHOOLS**

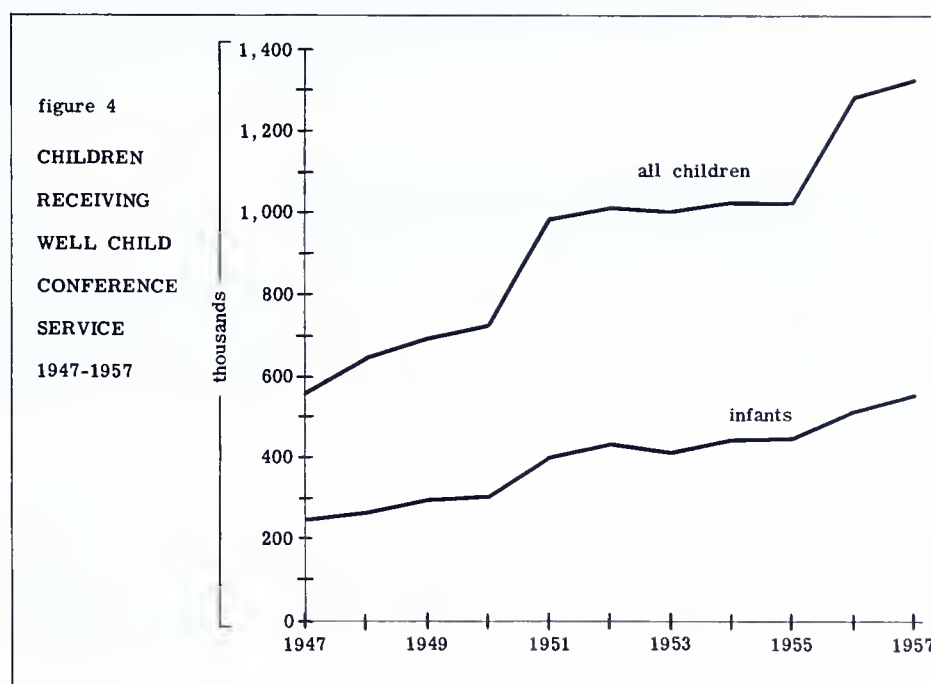

1957		2,878,127
1956		2,980,606

The total number of children (birth through age 20) served by public health nurses in maternal and child health programs was 2,878,127 in 1957, representing a slight decline from 1956. The distribution of this total by age groups was as follows:

TABLE C.--Child Health Nursing Service, by Age Group, 1957

Age group	Number of children ¹
All ages.....	2,878,127
Under 1.....	687,073
1-4.....	829,741
5-17.....	1,034,919
18-20.....	18,024
Not given.....	308,370

¹ In addition to number of children served by nurses in well child conferences where physicians are in attendance and on school premises.

School Health Service

As has been the case in past years, the type of service most commonly provided under school health programs was screening for visual defects. In 1957 this service was given to 4,088,647 children, representing an increase of 14 percent over the previous year. Significant increases were also registered for audiometer testing, 2,908,124 children, up 16.4 percent over 1956, and dental screening, 2,611,628 children, 7.6 percent above the 1956 figure.

Children examined by physicians in the school health program held about even, with 2,205,905 in 1957 against 2,215,517 in 1956. Changes in the number of States providing each of the above services were relatively minor. In the case of visual screening this number decreased from 47 to 45; for audiometer testing it went up from 42 to 44; dental screening was provided by 48 States in 1957, up from 45 the previous year; and 41 States furnished examinations by physicians in 1957, as against 42 in 1956. Reports are not received on the service of nurses on school premises; children visited in their homes by school nurses are included in Table C.

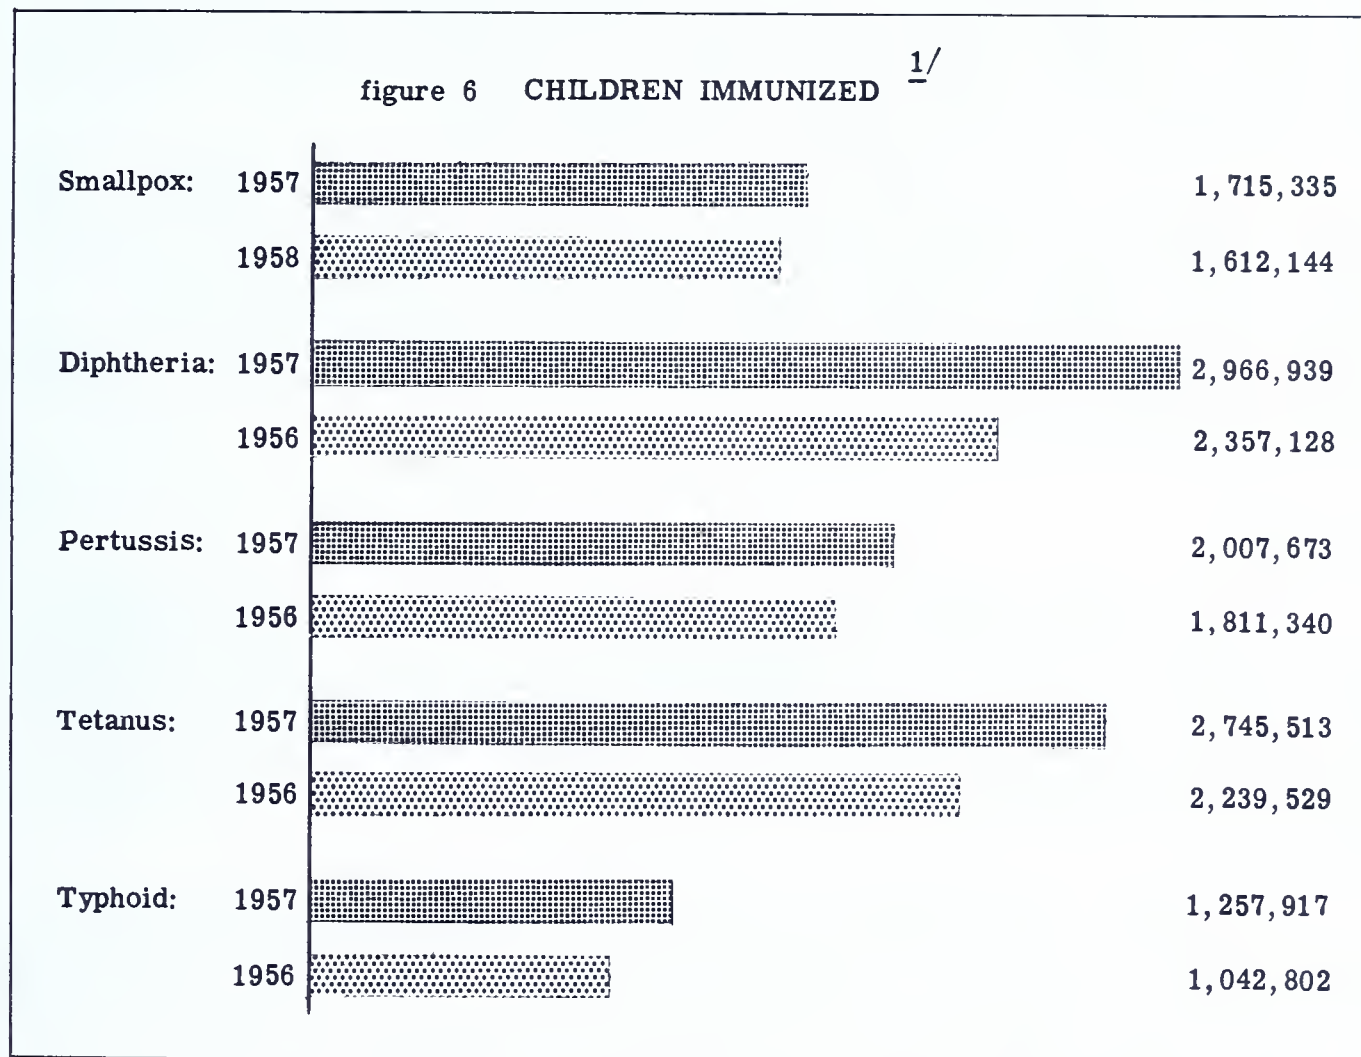

figure 5 CHILDREN GIVEN SCHOOL HEALTH EXAMINATIONS AND SCREENING

Examination by physician:	1957		2,205,905
	1956		2,215,517
Screening: Visual	1957		4,088,647
	1956		3,587,255
Audiometer	1957		2,908,124
	1956		2,497,459
Dental	1957		2,611,628
	1956		2,427,258

Immunization

A record number of children received immunizations in 1957. Children receiving original smallpox vaccinations numbered 1,373,671 and those revaccinated, 341,664, a 6.4 percent rise in the total number of children over 1956; the basic series of diphtheria immunizations given to 1,554,032 children and boosters for 1,412,907 reflected a 25.9 percent increase; the number of children receiving pertussis immunizations rose 10.8 percent; tetanus, 22.6 percent; and typhoid 20.6 percent. (See tables 10-13)

figure 6 CHILDREN IMMUNIZED ^{1/}

¹ These figures on children immunized are arrived at by adding together the numbers of children receiving both original vaccinations or basic series and those given revaccinations or booster shots during the year. Thus they represent the total number of children who received protection against these diseases as a part of the maternal and child health programs of State and local health departments.

The number receiving the basic series for poliomyelitis immunization and boosters, on the contrary, declined from 13,209,170 given in 1956 to 11,809,069 in 1957, a drop of 10.6 percent. The poliomyelitis figure for 1957 is provisional and subject to correction. (See Table 14)

In addition to the immunizations mentioned above, other types of immunization are given from time to time in certain States when warranted by local conditions.

Other Services

In addition to direct services to mothers and children of the kinds described above, health departments usually organize and conduct a varying amount of educational services. Classes in health education are held in a large number of States, especially classes for expectant parents. In 1957 classes for expectant parents were attended by 48,782, and other classes related to maternal and child health, by 84,765 persons.

In those States where midwives perform a significant number of deliveries, registers of practicing midwives are kept and activities are pursued directed toward improving their abilities and safeguarding the health of mothers. Table B shows 28 States reporting a total of 10,087 midwives. Eighteen of these States conducted classes attended by 6,588. As part of the training, a total of 1,908 deliveries by midwives were supervised by health department personnel in 12 States.

State Detail

In the tables which follow, breakdowns of the services discussed above are given, showing the numbers which have been reported by each State. Details by age group are given for child health services, children served in well child conferences are divided into those residing in metropolitan and nonmetropolitan counties as defined by the Census Bureau,¹ and the tables for school examinations and screenings show the number and percent of children examined by physicians when parents were present.

¹ Except in New England, a county is included in a standard metropolitan area if it contains at least one city of 50,000 or more according to the 1950 Census, or if it is contiguous to a metropolitan county and, according to specified criteria, it is essentially metropolitan in character and is socially and economically integrated with the central city or cities of the area. In New England, towns and cities rather than counties are the units used to define standard metropolitan areas. However, for purposes of Children's Bureau reporting, the total county is the report unit; therefore, all New England counties with more than half their population in standard metropolitan areas are classified as "metropolitan." This classification corresponds to that used by the Bureau of the Census in defining metropolitan State economic areas in New England.

FOOTNOTES FOR TABLES 1-17

1. Not included in program.
2. Not reported, information not given as to whether services are provided.
3. Included in program but number not reported.
4. Not reported separately. Included under ages 1-4.
5. 1-6 years of age
6. Reported from Baltimore.
7. Based on 2,161,883 examinations where parent information was reported.
8. Based on 137,754 examinations for which referral data was reported.
9. Parent information not reported for 761 examinations.
10. Based on 278,510 cases where referral data was reported.
11. Based on 79,927 cases where referral data was reported.
12. Based on 295,552 cases where referral data was reported.
13. Ages 6-20.
